**MONITOR CARE TIPS**

**Feeding** - Feed monitors daily. They require a proper variety of food items. Dusting food with calcium and vitamin powders helps keep your lizard healthy. Take note if your monitor does not eat.

**Water** - The water dish should be checked, cleaned and refilled every day.

**Heating and Temperature** - Make sure you offer your monitor the proper heat gradient. Place a thermometer at each end of the enclosure to track

temperatures. Be sure your heating source works properly, and immediately replace if it does not.

**Cleaning** - Spot-cleaning the cage daily to remove any soiled spots, shed skin or uneaten food. Replace substrate every week, and tear down the terrarium for a full cleaning once a month.

**Shedding** - Keep handling to a minimum while a lizard is shedding. Misting the lizard lightly with a water bottle can help ease a difficult shed.

**Defecation** - Regular defecation is a sign of good health.

**Health Check** - Inspect your lizard daily to make sure that the eyes are clear, the lizard does not have a runny nose, there are no signs of breathing difficulty, the skin looks good, and there are no shedding problems.

**\* Make sure to change out the full-spectrum light every six months. The date I bought my full-spectrum bulb was \_\_\_\_\_. The date I need to replace it is \_\_\_\_\_.**
